

We Just Met

Contact capture where the other person needs nothing. They speak, you selfie, and thirty seconds later their contact is saved, enriched with their LinkedIn, and a composed WhatsApp message with the selfie sits in their chat, one tap from send. They installed nothing, scanned nothing, signed up for nothing.

Try it

Android APK

`wejustmet-0.1.0.apk` (project folder), package
`app.wejustmet`, Android 10+

Live dashboard

wejustmet.vercel.app [live now](#)

Backend

Convex cloud, deployment `bright-meadowlark-411`

Source

github.com/rivora-labz/we-just-met (public): Android app +
`web/` dashboard and Convex functions; the git history is the
build log

Sideload the APK, open "Just Met", fill the one-time "This is you." card, and you are on the listening orb. WhatsApp must be installed.

The 30-second flow

1

The orb listens (gold ring while it hears you). The person you met says their name, number, company, and what you talked about.

2

Tap the orb or pause: "Ready for selfie, 3-2-1-GO". The camera opens while extraction runs in parallel on Convex.

3

The Review card arrives pre-filled, every field editable, message auto-composed from your saved profile (name, about, LinkedIn, Instagram).

4

"Send on WhatsApp" lands directly inside their chat via the `jid` intent extra (verified on device): selfie + message staged, one tap on WhatsApp's own send arrow.

5

Contact and selfie land in Convex; Context.dev finds their LinkedIn profile and role; the dashboard updates live with a gold "Connect on LinkedIn" chip and a 48h follow-up countdown.

The wedge

Every rival (HiHello, Blinq, Popl, Mobilo) needs both people in the system. This needs one. Capture wins you the right to win follow-up, and follow-up is where the category dies. The selfie plus "the thing we said we would do" is what restarts the relationship three weeks later.

Partner stack, all three load-bearing

Devin (Cognition)

Built the entire product in one day of CLI sessions. Every commit in the repo is Devin's: Android app, Convex backend, dashboard, deploys, on-device verification.

Convex

Contacts DB, selfie file storage, live dashboard subscription, server-side extraction action, enrichment pipeline state. Project provisioned via the Management API from a team token.

Context.dev

The enrichment layer. After every save, a Convex action finds the person (name + company): People Enrichment API first, Web Search fallback. Proven live: "Sundar Pichai / Google" resolved to CEO plus the real LinkedIn profile URL.

Architecture

App	Android, Jetpack Compose, Material 3, single module, Rivora light theme tokens
Ears	On-device platform <code>SpeechRecognizer</code> , live partial transcript under the orb
Brain	Convex action: spoken digit words to E.164 (+971 default), name/role/company/note extraction; the editable Review card is the human net
Send	<code>ACTION_SEND</code> + <code>EXTRA_STREAM</code> (<code>FileProvider</code>) + <code>jid</code> extra, straight into the WhatsApp chat; share sheet is the graceful fallback for bad numbers
Dashboard	Vite + React on Vercel, live everywhere via the Convex websocket

Honest edges

- LinkedIn connect is one human click on the enriched profile. Deliberate: no ToS-breaking automation, and no public invite API exists.
- The release APK is debug-key signed for sideload distribution; a real keystore goes in before any store upload.

- The 48h follow-up nudge renders as a live countdown chip; the scheduled send function is the first post-hackathon task.
